

PRACTICAL FILE OF OPERATING SYSTEM

BTech: III Year

Department of Computer Science & Information Technology

Name of the Student : ABHISHEK SINGH

Branch & section : CSIT - 1

Roll No. : 0827CI201008

Year : 3rd YEAR

**Department of Computer Science & Information Technology
AITR, Indore,**

ACROPOLIS INSTITUTE OF TECHNOLOGY & RESEARCH, INDORE

Department of Computer Science & Information Technology

Certificate

This is to certify that the experimental work entered in this journal as per the BTech III year syllabus prescribed by the RGPV was done by Mr. Abhishek Singh in 5th semester in the Laboratory of this institute during the academic year 2022-2023

Signature of Head

Signature of the Faculty

ACROPOLIS INSTITUTE OF TECHNOLOGY & RESEARCH, INDORE GENERAL INSTRUCTIONS FOR LABORATORY CLASSES

DO'S

- Without Prior permission do not enter into the Laboratory.
- While entering into the LAB students should wear their ID cards.
- The Students should come with proper uniform.
- Students should maintain silence inside the laboratory.
- After completing the laboratory exercise, make sure to shutdown the system properly.

DONT'S

- Students bringing the bags inside the laboratory.
- Students using the computers in an improper way.
- Students scribbling on the desk and mishandling the chairs.
- Students using mobile phones inside the laboratory.
- Students making noise inside the laboratory.

SYLLABUS

CS-502 – Operating System

Branch: Computer Science Information Technology V Semester

Course: CSIT 502 Operating System

Unit I

Introduction to System Programs & Operating Systems, Evolution of Operating System (mainframe, desktop, multiprocessor, Distributed, Network Operating System, Clustered & Handheld System), Operating system services, Operating system structure, System Call & System Boots, Operating system design & Implementations, System protection, Buffering & Spooling. Types of Operating System: Bare machine, Batch Processing, Real Time, Multitasking & Multiprogramming, time-sharing system.

Unit II

File: concepts, access methods, free space managements, allocation methods, and directory systems, protection, organization, sharing & implementation issues, Disk & Drum Scheduling, I/O devices organization, I/O devices organization, I/O buffering, I/O Hardware, Kernel I/O subsystem, Transforming I/O request to hardware operations. Device Driver: Path managements, Sub module, Procedure, Scheduler, Handler, Interrupt Service Routine. File system in Linux & Windows

Unit III

Process: Concept, Process Control Blocks (PCB), Scheduling criteria Preemptive & non Preemptive process scheduling, Scheduling algorithms, algorithm evaluation, multiple processor scheduling, real time scheduling, operations on processes, threads; inter process communication, precedence graphs, critical section problem, semaphores, and classical problems of synchronization. Deadlock: Characterization, Methods for deadlock handling, deadlock prevention, deadlock avoidance, deadlock detection, recovery from deadlock, Process Management in Linux.

Unit IV

Memory Hierarchy, Concepts of memory management, MFT & MVT, logical and physical address space, swapping, contiguous and non-contiguous allocation, paging, segmentation, and paging combined with segmentation. Structure & implementation of Page table. Concepts of virtual memory, Cache Memory Organization, demand paging, page replacement algorithms, allocation of frames, thrashing, and demand segmentation.

Unit V

Distributed operating system:-Types, Design issues, File system, Remote file access, RPC, RMI, Distributed Shared Memory(DSM), Basic Concept of Parallel Processing & Concurrent Programming Security & threats protection: Security violation through Parameter, Computer Worms & Virus, Security Design Principle, Authentications, Protection Mechanisms. introduction to Sensor network and parallel operating system. Case study of Unix, Linux & Windows.

HARDWARE REQUIREMENTS:

Processors - 2.0 GHz or Higher
RAM - 256 MB or Higher
Hard Disk - 20 GB or Higher

SOFTWARE REQUIREMENTS:

Linux: Ubuntu / OpenSUSE / Fedora / Red Hat / Debian / Mint OS
WINDOWS: XP/7
Linux could be loaded in individual PCs.

ACROPOLIS INSTITUTE OF TECHNOLOGY & RESEARCH, INDORE

FCFS SCHEDULING

Name of Student: Abhishek Singh		Class: BTech
Enrollment No:0827CI201008		Batch
Date of Experiment	Date of Submission	Submitted on:
Remarks by faculty:		Grade:
Signature of student:		Signature of Faculty:

OBJECTIVE OF THE EXPERIMENT

To write c++ program to implement the FCFS SCHEDULING.

FACILITIES REQUIRED

a) Facilities Required Doing The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	WINDOWS XP/7	

b) Concept of FCFS:

- Jobs are executed on first come, first serve basis.
- Easy to understand and implement.
- Poor in performance as average wait time is high.

Process	Arrival Time	Execute Time	Service Time
P0	0	5	0
P1	1	3	5
P2	2	8	8
P3	3	6	16

Algorithm:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process id and accept the CPU burst

timeStep 4: Set the waiting of the first process as '0' and its burst time as its turn

around time Step 5: for each process in the Ready Q calculate

- (a) Waiting time for process(n)= waiting time of process (n-1) + Burst time of process(n-1)
- (b) Turn around time for Process(n)= waiting time of Process(n)+ Burst time for process(n)

Step 6: Calculate

- (a) Average waiting time = Total waiting Time / Number of process
- (b) Average Turnaround time = Total Turnaround Time / Number of process

- (c) Step 7: Stop the process

d)Program:

```
#include<bits/stdc++.h>
#include<iostream>
using namespace std;

class FCFS{
    public:

    void FunCompetitionTime(int completiontime[],int bursttime[],int NoOfProcess){
        completiontime[0]=bursttime[0];
        for(int i=1; i<NoOfProcess; i++){
            completiontime[i]=completiontime[i-1]+bursttime[i];
        }

    }

    void FunTurnAroundTime(int completiontime[], int arrivaltime[], int turnaroundtime[],
        int NoOfProcess){
        for(int i=0; i<NoOfProcess; i++){
            turnaroundtime[i]=completiontime[i]-arrivaltime[i];
        }
    }

    void FunWaitingTime(int bursttime[], int turnaroundtime[], int waitingtime[], int
        NoOfProcess){

        for(int i=0; i<NoOfProcess; i++){
            waitingtime[i]=turnaroundtime[i] - bursttime[i];
        }

    }

};

int main(){
    int NoOfProcess=4;
```

```

float avgwaiting=0.0,avgturnaroundtime=0.0;
int bursttime[]={ 5,3,8,6}, completiontime[NoOfProcess],
turnaroundtime[NoOfProcess], waitingtime[NoOfProcess],
arrivaltime[NoOfProcess]={0,1,2,3};

FCFS table1;
table1.FunCompetitionTime(completiontime, bursttime, NoOfProcess);
table1.FunTurnAroundTime(completiontime, arrivaltime, turnaroundtime,
NoOfProcess);
table1.FunWaitingTime(bursttime, turnaroundtime, waitingtime, NoOfProcess);

cout<<"ID"<<"|"<<"Arrival"<<"|"<<"Burst"<<"|"<<"completion"<<"|"<<"turnaround"<
<"|"<<"waiting"<<endl;

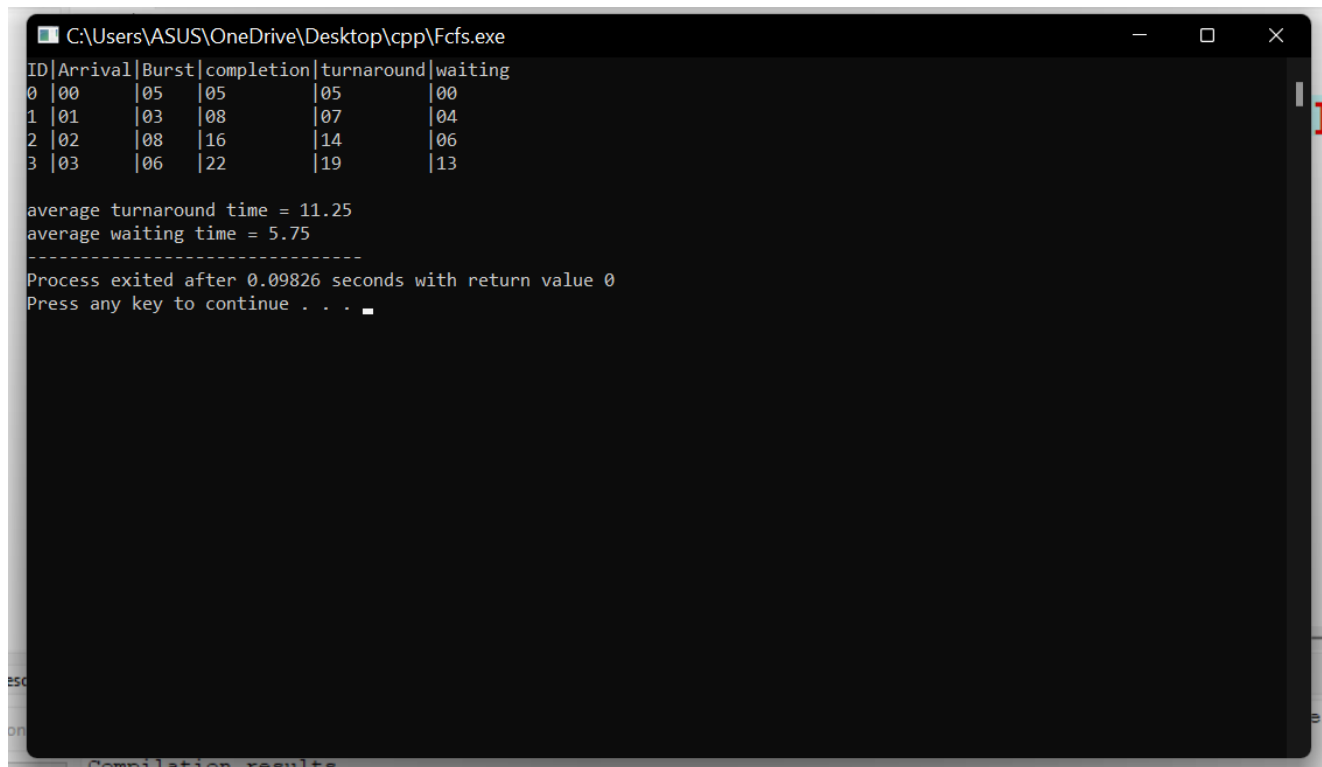

for(int i=0; i<NoOfProcess; i++){
cout<<i<<"|";
cout<<setw(2)<<setfill('0')<<arrivaltime[i]<<"|";
cout<<setw(2)<<setfill('0')<<bursttime[i]<<"|";
cout<<setw(2)<<setfill('0')<<completiontime[i]<<"|";
cout<<setw(2)<<setfill('0')<<turnaroundtime[i]<<"|";
cout<<setw(2)<<setfill('0')<<waitingtime[i]<<endl;
}

for(int i=0; i<NoOfProcess; i++){
avgwaiting = avgwaiting + waitingtime[i];
avgturnaroundtime = avgturnaroundtime + turnaroundtime[i];
}
cout<<endl<<"average turnaround time = "<< avgturnaroundtime/NoOfProcess;
cout<<endl<<"average waiting time = "<<avgwaiting/NoOfProcess;

return 0;
}

```

e)Output

```
C:\Users\ASUS\OneDrive\Desktop\cpp\Fcfs.exe
ID|Arrival|Burst|completion|turnaround|waiting
0 |00    |05    |05    |05    |00
1 |01    |03    |08    |07    |04
2 |02    |08    |16    |14    |06
3 |03    |06    |22    |19    |13

average turnaround time = 11.25
average waiting time = 5.75
-----
Process exited after 0.09826 seconds with return value 0
Press any key to continue . . .
```

Result:

Average Waiting Time 11.25 .

Average Turnaround Time 5.75 .

Experiment-2

SJF Scheduling

Name of Student: Abhishek Singh		Class: BTech
Enrollment No: 0827CI201008		Batch
Date of Experiment	Date of Submission	Submitted on:
Remarks by faculty:		Grade:
Signature of student:		Signature of Faculty:

OBJECTIVE OF THE EXPERIMENT

To write c++ program to implement SJF CPU Scheduling Algorithm.

FACILITIES REQUIRED

a) Facilities Required Doing The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	WINDOWS XP/7	

b) Concept of SJF:

- Best approach to minimize waiting time.
- Processer should know in advance how much time process will take.

Process	Arrival Time	Execute Time	Service Time
P0	0	5	0
P1	1	3	3
P2	2	8	8
P3	3	6	16

Algorithm:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process id and accept the CPU burst time

Step 4: Start the Ready Q according the shortest Burst time by sorting according to lowest to highest burst time.

Step 5: Set the waiting time of the first process as '0' and its turnaround time as its burst time.

Step 6: For each process in the ready queue, calculate

(d) Waiting time for process(n)= waiting time of process (n-1) + Burst time of process(n-1)

(e) Turnaround time for Process(n)= waiting time of Process(n)+ Burst time for process(n)

Step 7: Calculate

(c) Average waiting time = Total waiting Time / Number of process

(d) Average Turnaround time = Total Turnaround Time / Number of process

Step 8: Stop the process

c) Program:

```
// C++ program to implement Shortest Remaining Time First
// Shortest Remaining Time First (SRTF)
```

```
#include <bits/stdc++.h>
using namespace std;
struct Process {
    int pid; // Process ID
    int bt; // Burst Time
```

```

    int art; // Arrival Time
};

void findWaitingTime(Process proc[], int n,int wt[])
{
    int rt[n];
    // Copy the burst time into rt[]
    for (int i = 0; i < n; i++)
        rt[i] = proc[i].bt;
    int complete = 0, t = 0, minm = INT_MAX;
    int shortest = 0, finish_time;
    bool check = false;
    while (complete != n) {
        for (int j = 0; j < n; j++) {
            if ((proc[j].art <= t) &&
                (rt[j] < minm) && rt[j] > 0) {
                minm = rt[j];
                shortest = j;
                check = true;
            }
        }

        if (check == false) {
            t++;
            continue;
        }
        rt[shortest]--;
        minm = rt[shortest];
        if (minm == 0)
            minm = INT_MAX;
        if (rt[shortest] == 0) {
            complete++;
            check = false;
            finish_time = t + 1;

            // Calculate waiting time
            wt[shortest] = finish_time -
                proc[shortest].bt - proc[shortest].art;

            if (wt[shortest] < 0)

```

```

        wt[shortest] = 0;
    }
    t++;
}

void findTurnAroundTime(Process proc[], int n,
                        int wt[], int tat[])
{
    for (int i = 0; i < n; i++)
        tat[i] = proc[i].bt + wt[i];
}

void findavgTime(Process proc[], int n)
{
    int wt[n], tat[n], total_wt = 0,
        total_tat = 0;
    findWaitingTime(proc, n, wt);
    findTurnAroundTime(proc, n, wt, tat);
    cout << " P\t\t" << "BT\t\t" << "WT\t\t" << "TAT\t\t\n";
    for (int i = 0; i < n; i++) {
        total_wt = total_wt + wt[i];
        total_tat = total_tat + tat[i];
        cout << " " << proc[i].pid << "\t\t"
            << proc[i].bt << "\t\t" << wt[i]
            << "\t\t" << tat[i] << endl;
    }
    cout << "\nAverage waiting time = "
        << (float)total_wt / (float)n;
    cout << "\nAverage turn around time = "
        << (float)total_tat / (float)n;
}

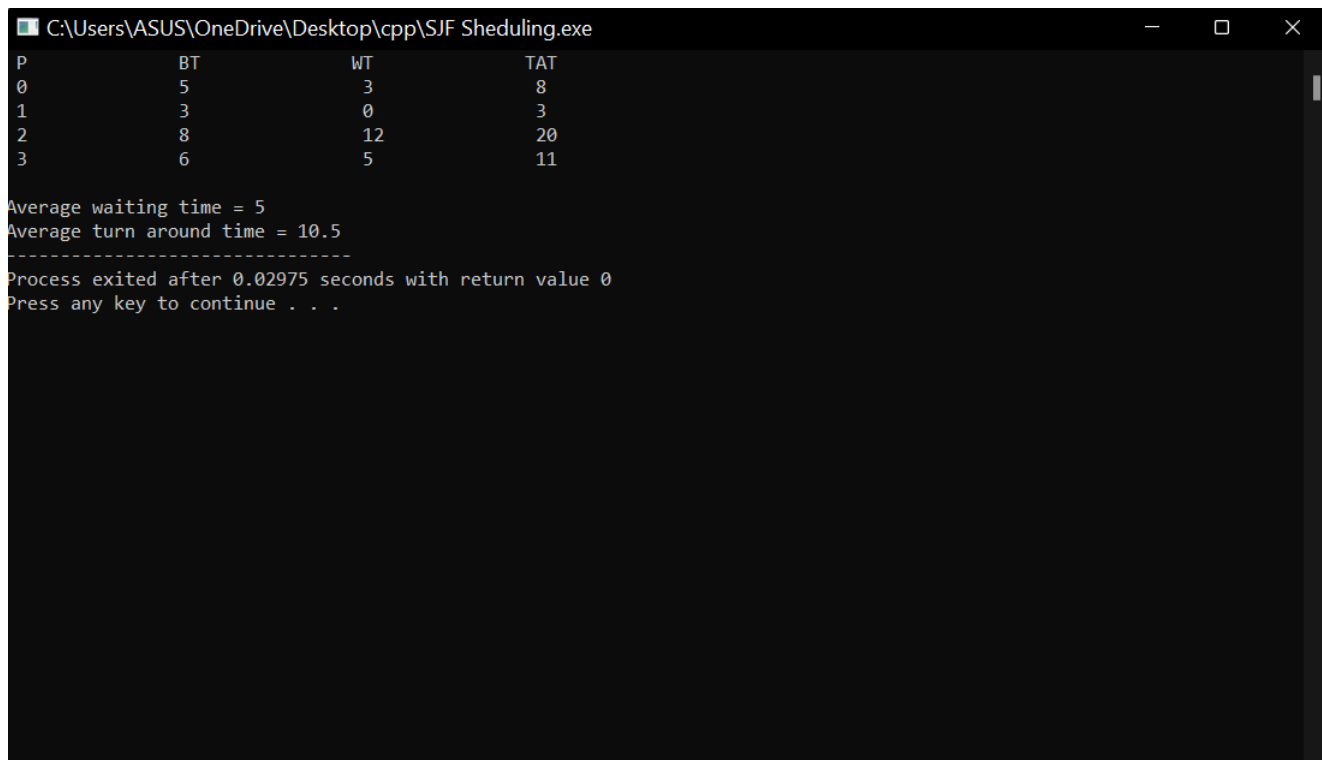

int main()
{
    Process proc[] = { { 0, 5, 0 }, { 1, 3, 1 },
                      { 2, 8, 2 }, { 3, 6, 3 } };
    int n = sizeof(proc) / sizeof(proc[0]);

    findavgTime(proc, n);
    return 0;
}

```

}

d) Output:

```
C:\Users\ASUS\OneDrive\Desktop\cpp\SJF Sheduling.exe
P      BT      WT      TAT
0       5       3       8
1       3       0       3
2       8      12      20
3       6       5      11

Average waiting time = 5
Average turn around time = 10.5
-----
Process exited after 0.02975 seconds with return value 0
Press any key to continue . . .
```

Result:

Average Waiting Time = 5

Average Turnaround Time = 10.5

Experiment-3

SRTF Scheduling

Name of Student: Abhishek Singh		Class: BTech
Enrplment No: 0827CI201008		Batch
Date of Experiment	Date of Submission	Submitted on:
Remarks by faculty:		Grade:
Signature of student:		Signature of Faculty:

OBJECTIVE OF THE EXPERIMENT

To write c program to implement SRTF scheduling.

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept Of SRTF Scheduling:

- Associate with each process the length of its next CPU burst. Use these lengths to schedule the process with the shortest time.
- Two schemes:
 1. non pre- emptive – once CPU given to the process it cannot be preempted until completes its CPU burst.
 2. Preemptive – if a new process arrives with CPU burst length less than remaining time of current executing process, preempt. This scheme is known as the Shortest-Remaining-Time-First (SRTF).

Example of Preemptive SJF

Process	Arrival Time	Burst Time
P1	0.0	7
P2	2.0	4
P3	4.0	1
P4	5.0	4

SJF (preemptive)

P1	P2	P3	P2	P4	P1	
0	2	4	5	7	11	16

Algorithm:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process id and accept the CPU burst

timeStep 4: For each process in the ready Q, Accept Arrival time

Step 4: Start the Ready Q according the shortest Burst time by sorting according to lowest toHighest burst time.

Step 5: Set the waiting time of the first process in Sorted Q as '0'.

Step 6: After every unit of time compare the remaining time of currently executing process (RT) and Burst time of newly arrived process (BT_n).

Step 7: If the burst time of newly arrived process (BT_n) is less than the currently executing process (RT) the processor will preempt the currently executing process and starts executing newly arrived process

Step 7: Calculate

(e) $\text{Average waiting time} = \text{Total waiting Time} / \text{Number of process}$

(f) $\text{Average Turnaround time} = \text{Total Turnaround Time} / \text{Number of process}$

Step 8: Stop the process

Program:

```
// C++ program to implement Shortest Remaining Time First
// Shortest Remaining Time First (SRTF)

#include <bits/stdc++.h>
using namespace std;

struct Process {
    int pid; // Process ID
    int bt; // Burst Time
    int art; // Arrival Time
};

// Function to find the waiting time for all
// processes
void findWaitingTime(Process proc[], int n, int wt[])
{
    int rt[n];

    // Copy the burst time into rt[]
    for (int i = 0; i < n; i++)
        rt[i] = proc[i].bt;

    int complete = 0, t = 0, minm = INT_MAX;
    int shortest = 0, finish_time;
    bool check = false;

    // Process until all processes gets
    // completed
    while (complete != n) {

        // Find process with minimum
        // remaining time among the
        // processes that arrives till the
        // current time`
        for (int j = 0; j < n; j++) {
            if ((proc[j].art <= t) &&
                (rt[j] < minm) && rt[j] > 0) {
                minm = rt[j];
                shortest = j;
                check = true;
            }
        }

        if (check == false) {
```

```

        t++;
        continue;
    }

    // Reduce remaining time by one
    rt[shortest]--;

    // Update minimum
    minm = rt[shortest];
    if (minm == 0)
        minm = INT_MAX;

    // If a process gets completely
    // executed
    if (rt[shortest] == 0) {

        // Increment complete
        complete++;
        check = false;

        // Find finish time of current
        // process
        finish_time = t + 1;

        // Calculate waiting time
        wt[shortest] = finish_time -
                        proc[shortest].bt -
                        proc[shortest].art;

        if (wt[shortest] < 0)
            wt[shortest] = 0;
    }
    // Increment time
    t++;
}

// Function to calculate turn around time
void findTurnAroundTime(Process proc[], int n,
                        int wt[], int tat[])
{
    // calculating turnaround time by adding
    // bt[i] + wt[i]
    for (int i = 0; i < n; i++)
        tat[i] = proc[i].bt + wt[i];
}

```

```

// Function to calculate average time
void findavgTime(Process proc[], int n)
{
    int wt[n], tat[n], total_wt = 0,
                                     total_tat = 0;

    // Function to find waiting time of all
    // processes
    findWaitingTime(proc, n, wt);

    // Function to find turn around time for
    // all processes
    findTurnAroundTime(proc, n, wt, tat);

    // Display processes along with all
    // details
    cout << " P\t\t"
           << "BT\t\t"
           << "WT\t\t"
           << "TAT\t\t\n";
    for (int i = 0; i < n; i++) {
        total_wt = total_wt + wt[i];
        total_tat = total_tat + tat[i];
        cout << " " << proc[i].pid << "\t\t"
              << proc[i].bt << "\t\t " << wt[i]
              << "\t\t " << tat[i] << endl;
    }

    cout << "\nAverage waiting time = "
          << (float)total_wt / (float)n;
    cout << "\nAverage turn around time = "
          << (float)total_tat / (float)n;
}

int main()
{
    Process proc[] = { { 0, 7, 0 }, { 1, 4, 2 },
                       { 2, 1, 4 }, { 3, 4, 5 } };
    int n = sizeof(proc) / sizeof(proc[0]);

    findavgTime(proc, n);
    return 0;
}

```

Output:

```
C:\Users\ASUS\OneDrive\Desktop\cpp\SJF Sheduling.exe
P      BT      WT      TAT
0       7       9      16
1       4       1       5
2       1       0       1
3       4       2       6

Average waiting time = 3
Average turn around time = 7
-----
Process exited after 0.03918 seconds with return value 0
Press any key to continue . . .
```

Result:

Average Waiting Time = 3

Average Turnaround Time = 7

Experiment-4

ROUND ROBIN Scheduling

Name of Student: Abhishek Singh		Class: BTech
Enrplment No: 0827CI201008		Batch
Date of Experiment	Date of Submission	Submitted on:
Remarks by faculty:		Grade:
Signature of student:		Signature of Faculty:

OBJECTIVE OF THE EXPERIMENT

To write c program to implement Round Robin scheduling.

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept Of Round Robin Scheduling:

This Algorithm is designed especially for time-sharing systems. A small unit of time, called time slices or **quantum** is defined. All runnable processes are kept in a circular queue. The CPU scheduler goes around this queue, allocating the CPU to each process for a time interval of one quantum. New processes are added to the tail of the queue. The CPU scheduler picks the first process from the queue, sets a timer to interrupt after one quantum, and dispatches the process. If the process is still running at the end of the quantum, the CPU is preempted and the process is added to the tail of the queue. If the process finishes before the end of the quantum, the process itself releases the CPU voluntarily. Every time a process is granted the CPU, a **context switch** occurs, this adds overhead to the process execution time.

	Burst
Process	Time
P_1	24
P_2	3

P_2	3
Average	

Algorithm:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue and time quantum (or) time

sliceStep 3: For each process in the ready Q, assign the process id and accept the CPU

burst timeStep 4: Calculate the no. of time slices for each process where

$$\text{No. of time slice for process}(n) = \text{burst time process}(n) / \text{time slice}$$

Step 5: If the burst time is less than the time slice then the no. of time slices =1.

Step 6: Consider the ready queue is a circular Q, calculate

(a) Waiting time for process(n) = waiting time of process(n-1)+ burst time of process(n-1)

) + the time difference in getting the CPU from process(n-1)

(b) Turn around time for process(n) = waiting time of process(n) + burst time of process(n)+ the time difference in getting CPU from process(n).

Step 7: Calculate

(g) Average waiting time = Total waiting Time / Number of process

(h) Average Turnaround time = Total Turnaround Time / Number

of processStep 8: Stop the process

Program:

```
// C++ program for implementation of RR scheduling
#include<iostream>
using namespace std;

// Function to find the waiting time for all
// processes
void findWaitingTime(int processes[], int n,
                    int bt[], int wt[], int quantum)
{
    // Make a copy of burst times bt[] to store remaining
    // burst times.
    int rem_bt[n];
    for (int i = 0 ; i < n ; i++)
        rem_bt[i] = bt[i];

    int t = 0; // Current time

    // Keep traversing processes in round robin manner
    // until all of them are not done.
    while (1)
    {
        bool done = true;

        // Traverse all processes one by one repeatedly
        for (int i = 0 ; i < n; i++)
        {
            // If burst time of a process is greater than 0
            // then only need to process further
            if (rem_bt[i] > 0)
            {
                done = false; // There is a pending process

                if (rem_bt[i] > quantum)

Result:

Average Waiting Time = 6.33333

Average Turnaround Time 16.3333

Experiment-5

PRIORITY SCHEDULING

Name of Student: Abhishek Singh		Class: BTech	
Enrplment No: 0827CI201008		Batch	
Date of Experiment	Date of Submission		Submitted on:
Remarks by faculty:		Grade:	
Signature of student:		Signature of Faculty:	

OBJECTIVE OF THE EXPERIMENT

To write c program to implement Priority scheduling.

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept Of Priority Scheduling:

A priority is associated with each process, and the CPU is allocated to the process with the highest priority. Equal-priority processes are scheduled in FCFS order.

An SJF algorithm is simply a priority algorithm where the priority (p) is the inverse of the (predicted) next CPU burst. The larger the CPU burst, the lower the priority, and vice versa.

As an example, consider the following set of processes, assumed to have arrived at time 0, in the order

	Burst		Waiting	Turnaround
Process	Time	Priority	Time	Time
	10	3	6	16
	1	1	0	1
	2	4	16	18
	1	5	18	19

	5	2	1	6
Average	-	-	8.2	12

{31452}

Algorithm:

Step 1: Start process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process id and accept the CPU burst

timeStep 4: Sort the ready queue according to the priority number.

Step 5: Set the waiting of the first process as '0' and its burst time as its turn around

timeStep 6: For each process in the Ready Q calculate

(e) Waiting time for process(n)= waiting time of process (n-1) + Burst time of process(n-1)

(f) Turn around time for Process(n)= waiting time of Process(n)+ Burst time for process(n)

Step 7: Calculate

(i) Average waiting time = Total waiting Time / Number of process

(j) Average Turnaround time = Total Turnaround Time / Number of

processStep 8: Stop the process

Program:

```
// C++ implementation for Priority Scheduling with
//Different Arrival Time priority scheduling
/*1. sort the processes according to arrival time
2. if arrival time is same the acc to priority
3. apply fcfs
*/

#include <bits/stdc++.h>

using namespace std;

#define totalprocess 5

// Making a struct to hold the given input

struct process
{
int at, bt, pr, pno;
};

process proc[50];

/*
Writing comparator function to sort according to priority if
arrival time is same
*/

bool comp(process a, process b)
{
if(a.at == b.at)
{
return a.pr < b.pr;
}
else
{
return a.at < b.at;
}
}

// Using FCFS Algorithm to find Waiting time
void get_wt_time(int wt[])
{
// declaring service array that stores cumulative burst time
int service[50];
```

```

// Initialising initial elements of the arrays
service[0] = proc[0].at;
wt[0]=0;

for(int i=1;i<totalprocess;i++)
{
service[i]=proc[i-1].bt+service[i-1];

wt[i]=service[i]-proc[i].at;

// If waiting time is negative, change it into zero

        if(wt[i]<0)
        {
            wt[i]=0;
        }
    }

}

void get_tat_time(int tat[],int wt[])
{
// Filling turnaroundtime array

for(int i=0;i<totalprocess;i++)
{
    tat[i]=proc[i].bt+wt[i];
}

}

void findgc()
{

int wt[50],tat[50];

double wavg=0,tavg=0;

// Function call to find waiting time array
get_wt_time(wt);
//Function call to find turnaround time
get_tat_time(tat,wt);

int stime[50],ctime[50];

stime[0] = proc[0].at;

```

```

ctime[0]=stime[0]+tat[0];

// calculating starting and ending time
for(int i=1;i<totalprocess;i++)
{
    stime[i]=ctime[i-1];
    ctime[i]=stime[i]+tat[i]-wt[i];
}

cout<<"Process_no\tStart_time\tComplete_time\tTurn_Around_Time\tWaiting_Time"<<endl;
for(int i=0;i<totalprocess;i++)
{
    wavg += wt[i];
    tavg += tat[i];

    cout<<proc[i].pno<<"\t\t"<<
        stime[i]<<"\t\t"<<ctime[i]<<"\t\t"<<
        tat[i]<<"\t\t"<<wt[i]<<endl;
}

cout<<"Average waiting time is : ";
cout<<wavg/(float)totalprocess<<endl;
cout<<"average turnaround time : ";
cout<<tavg/(float)totalprocess<<endl;

}

int main()
{
    int arrivalttime[] = { 1, 2, 3, 4, 5 };
    int bursttime[] = { 10, 1, 2, 1, 5 };
    int priority[] = { 3, 1, 4, 5, 2 };

    for(int i=0;i<totalprocess;i++)
    {
        proc[i].at=arrivalttime[i];
        proc[i].bt=bursttime[i];
        proc[i].pr=priority[i];
        proc[i].pno=i+1;
    }
    sort(proc,proc+totalprocess,comp);
    findgc();

    return 0;
}

```

Output:

```
C:\Users\ASUS\OneDrive\Desktop\cpp\Untitled1.exe
Process_no    Start_time    Complete_time  Turn_Around_Time  Waiting_Time
1             1             11             10                0
2             11            12             10                9
3             12            14             11                9
4             14            15             11                10
5             15            20             15                10
Average waiting time is : 7.6
Average turnaround time : 11.4
-----
Process exited after 0.04155 seconds with return value 0
Press any key to continue . . .
```

Result:

Average Waiting Time = 7.6

Average Turnaround Time 11.4

Experiment-6

BANKER ALGORITHM

Name of Student: Abhishek Singh		Class: BTech	
Enrollment No: 0827CI201008		Batch	
Date of Experiment	Date of Submission		Submitted on:
Remarks by faculty:		Grade:	
Signature of student:		Signature of Faculty:	

OBJECTIVE OF THE EXPERIMENT

To write c program to implement deadlock avoidance & Prevention by using Banker's Algorithm.

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept Of BANKER'S Algorithm:

The Banker's algorithm is a resource allocation and deadlock avoidance algorithm that tests for safety by simulating the allocation of predetermined maximum possible amounts of all resources, and then makes an "s-state" check to test for possible deadlock conditions for all other pending activities, before deciding whether allocation should be allowed to continue.

- Always keep so many resources that satisfy the needs of at least one client
- Multiple instances.
- Each process must a priori claim maximum use.
- When a process requests a resource it may have to wait.
- When a process gets all its resources it must return them in a finite amount of time.

Algorithm:

1. Start the program.
2. Get the values of resources and processes.
3. Get the avail value.
4. After allocation find the need value.
5. Check whether it's possible to allocate.
6. If it is possible then the system is in safe state.
7. Else system is not in safety state.
8. If the new request comes then check that the system is in safety.
9. Or not if we allow the request.
10. Stop the program.

Program:

```
// C++ program to illustrate Banker's Algorithm
#include<iostream>
using namespace std;

// Number of processes
const int P = 5;

// Number of resources
const int R = 3;

// Function to find the need of each process
void calculateNeed(int need[P][R], int maxm[P][R],
                  int allot[P][R])
{
    // Calculating Need of each P
    for (int i = 0 ; i < P ; i++)
        for (int j = 0 ; j < R ; j++)

            // Need of instance = maxm instance -
            //                               allocated instance
            need[i][j] = maxm[i][j] - allot[i][j];
}

// Function to find the system is in safe state or not
bool isSafe(int processes[], int avail[], int maxm[][R],
            int allot[][R])
{
    int need[P][R];

    // Function to calculate need matrix
    calculateNeed(need, maxm, allot);

    // Mark all processes as in finish
    bool finish[P] = {0};

    // To store safe sequence
    int safeSeq[P];

    // Make a copy of available resources
    int work[R];
    for (int i = 0; i < R ; i++)
        work[i] = avail[i];
```

```

// While all processes are not finished
// or system is not in safe state.
int count = 0;
while (count < P)
{
    // Find a process which is not finish and
    // whose needs can be satisfied with current
    // work[] resources.
    bool found = false;
    for (int p = 0; p < P; p++)
    {
        // First check if a process is finished,
        // if no, go for next condition
        if (finish[p] == 0)
        {
            // Check if for all resources of
            // current P need is less
            // than work
            int j;
            for (j = 0; j < R; j++)
                if (need[p][j] > work[j])
                    break;

            // If all needs of p were satisfied.
            if (j == R)
            {
                // Add the allocated resources of
                // current P to the available/work
                // resources i.e.free the resources
                for (int k = 0 ; k < R ; k++)
                    work[k] += allot[p][k];

                // Add this process to safe sequence.
                safeSeq[count++] = p;

                // Mark this p as finished
                finish[p] = 1;

                found = true;
            }
        }
    }

    // If we could not find a next process in safe
    // sequence.
    if (found == false)
    {

```

```

        cout << "System is not in safe state";
        return false;
    }
}

// If system is in safe state then
// safe sequence will be as below
cout << "System is in safe state.\nSafe"
    " sequence is: ";
for (int i = 0; i < P ; i++)
    cout << safeSeq[i] << " ";

return true;
}

// Driver code
int main()
{
    int processes[] = {0, 1, 2, 3, 4};

    // Available instances of resources
    int avail[] = {3, 3, 2};

    // Maximum R that can be allocated
    // to processes
    int maxm[][R] = {{7, 5, 3},
                     {3, 2, 2},
                     {9, 0, 2},
                     {2, 2, 2},
                     {4, 3, 3}};

    // Resources allocated to processes
    int allot[][R] = {{0, 1, 0},
                     {2, 0, 0},
                     {3, 0, 2},
                     {2, 1, 1},
                     {0, 0, 2}};

    // Check system is in safe state or not
    isSafe(processes, avail, maxm, allot);

    return 0;
}

```

Output:

```
C:\Users\ASUS\OneDrive\Desktop\cpp\SJF Sheduling.exe
System is in safe state.
Safe sequence is: 1 3 4 0 2
-----
Process exited after 0.02525 seconds with return value 0
Press any key to continue . . .
```

Result:

The Sequence Is: 1 3 4 0 2

FIFO PAGE REPLACEMENT

Name of Student: Abhishek Singh		Class: BTech
Enrollment No: 0827CI201008		Batch
Date of Experiment	Date of Submission	Submitted on:
Remarks by faculty:		Grade:
Signature of student:	Signature of Faculty:	

OBJECTIVE OF THE EXPERIMENT

To implement page replacement algorithm FIFO.

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept Fifo Page Replacement:

- Treats page frames allocated to a process as a circular buffer:
- When the buffer is full, the oldest page is replaced. Hence first-in, first-out: A frequently used page is often the oldest, so it will be repeatedly paged out by FIFO. Simple to implement: requires only a pointer that circles through the page frames of the process.

reference string

7 0 1 2 0 3 0 4 2 3 0 3 2 1 2 0 1 7 0 1

7	7	7	2	2	2	4	4	4	0	0	0	7	7	7
	0	0	0	3	3	3	2	2	2	1	1	1	0	0
		1	1	1	0	0	0	3	3	3	2	2	2	1

page frames

- FIFO Replacement manifests Belady's Anomaly:

more frames \Rightarrow more page faults

- Reference string: 1, 2, 3, 4, 1, 2, 5, 1, 2, 3, 4, 5()

3 Frames:-9 page fault

4 Frames: - 10 page fault

Algorithm:

Step 1: Create a queue to hold all pages in memory

Step 2: When the page is required replace the page at the head of the

queueStep 3: Now the new page is inserted at the tail of the queue

Program:

```
// C++ implementation of FIFO page replacement
// in Operating Systems.
#include<bits/stdc++.h>
using namespace std;

// Function to find page faults using FIFO
int pageFaults(int pages[], int n, int capacity)
{
    // To represent set of current pages. We use
    // an unordered_set so that we quickly check
    // if a page is present in set or not
    unordered_set<int> s;

    // To store the pages in FIFO manner
    queue<int> indexes;

    // Start from initial page
    int page_faults = 0;
    for (int i=0; i<n; i++)
    {
        // Check if the set can hold more pages
        if (s.size() < capacity)
        {
            // Insert it into set if not present
            // already which represents page fault
            if (s.find(pages[i])==s.end())
            {
                // Insert the current page into the set
                s.insert(pages[i]);

                // increment page fault
                page_faults++;

                // Push the current page into the queue
                indexes.push(pages[i]);
            }
        }
    }
}
```

```

    }
}

// If the set is full then need to perform FIFO
// i.e. remove the first page of the queue from
// set and queue both and insert the current page
else
{
    // Check if current page is not already
    // present in the set
    if (s.find(pages[i]) == s.end())
    {
        // Store the first page in the
        // queue to be used to find and
        // erase the page from the set
        int val = indexes.front();

        // Pop the first page from the queue
        indexes.pop();

        // Remove the indexes page from the set
        s.erase(val);

        // insert the current page in the set
        s.insert(pages[i]);

        // push the current page into
        // the queue
        indexes.push(pages[i]);

        // Increment page faults
        page_faults++;
    }
}

return page_faults;
}

// Driver code
int main()
{
    int pages[] = {7, 0, 1, 2, 0, 3, 0, 4,
                  2, 3, 0, 3, 2};
    int n = sizeof(pages)/sizeof(pages[0]);
    int capacity = 4;
    cout << " number of pageFaults arev = "<<pageFaults(pages, n, capacity);
    return 0;
}

```

}

Output:**Output**

```
/tmp/8K1GiQf1nB.o  
number of pageFaults arev = 7|
```

c) Result:

No. of page faults 7.

LRU PAGE REPLACEMENT

Name of Student: Abhishek Singh		Class: BTech	
Enrollment No: 0827CI201008		Batch	
Date of Experiment	Date of Submission	Submitted on:	
Remarks by faculty:		Grade:	
Signature of student:		Signature of Faculty:	

OBJECTIVE OF THE EXPERIMENT

To implement page replacement algorithm LRU.

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept of LRU Algorithm:

Pages that have been heavily used in the last few instructions will probably be heavily used again in the next few. Conversely, pages that have not been used for ages will probably remain unused for a long time. when a page fault occurs, throw out the page that has been unused for the longest time. This strategy is called LRU (Least Recently Used) paging.

Page reference stream:

1 2 3 2 1 5 2 1 6 2 5 6 3 1 3 6 1 2 4 3

1 1 1 1 3 2 1 5 2 1 6 2 5 6 6 1 3 6 1 2

2 2 3 2 1 5 2 1 6 2 5 6 3 1 3 6 1 2 4

3 2 1 5 2 1 6 2 5 6 3 1 3 6 1 2 4 3

* * * * *

LRU

Total 11 page faults

Algorithm:

Step 1: Create a queue to hold all pages in memory

Step 2: When the page is required replace the page at the head of the

queueStep 3: Now the new page is inserted at the tail of the queue

Step 4: Create a stack

Step 5: When the page fault occurs replace page present at the bottom of the stack

Program:

```
//C++ implementation of above algorithm
#include<bits/stdc++.h>
using namespace std;

// Function to find page faults using indexes
int pageFaults(int pages[], int n, int capacity)
{
    // To represent set of current pages. We use
    // an unordered_set so that we quickly check
    // if a page is present in set or not
    unordered_set<int> s;

    // To store least recently used indexes
    // of pages.
    unordered_map<int, int> indexes;

    // Start from initial page
    int page_faults = 0;

```
{  
    int pages[] = { 1,2,3,2,1,5,2,1,6,2,5,6,3,1,3,6,1,2,4,3};  
  
    int n = sizeof(pages)/sizeof(pages[0]);  
    int capacity = 3;  
    cout << pageFaults(pages, n, capacity);  
    return 0;  
}
```

OUTPUT:

Output

```
/tmp/8K1GiQf1nB.o  
11|
```

d) Result:

No. of pages faults 11.

Experiment-9

FCFS Disk Scheduling Algorithm

Name of Student: Abhishek Singh		Class: BTech
Enrollment No: 0827CI201008		Batch
Date of Experiment	Date of Submission	Submitted on:
Remarks by faculty:		Grade:
Signature of student:		Signature of Faculty:

OBJECTIVE OF THE EXPERIMENT

To implement FCFS Disk Scheduling Algorithm

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept of FCFS Disk Scheduling Algorithm:

All incoming requests are placed at the end of the queue. Whatever number that is next in the queue will be the next number served. Using this algorithm doesn't provide the best results. To determine the number of head movements you would simply find the number of tracks it took to move from one request to the next. For this case it went from 50 to 95 to 180 and so on. From 50 to 95 it moved 45 tracks. If you tally up the total number of tracks you will find how many tracks it had to go through before finishing the entire request. In this example, it had a total head movement of 640 tracks. The disadvantage of this algorithm is noted by the oscillation from track 50 to track 180 and then back to track 11 to 123 then to 64. As you will soon see, this is the worse algorithm that one can use.

Algorithm:

Step 1: Create a queue to hold all requests in disk

Step 2: Move the head to the request in FIFO order (Serve the request first that came

first)Step 3: Calculate the total head movement required to serve all request.

Program:

```
// C++ program to demonstrate
// FCFS Disk Scheduling algorithm

#include <bits/stdc++.h>
using namespace std;

int size = 8;

void FCFS(int arr[], int head)
{
    int seek_count = 0;
    int distance, cur_track;

    for (int i = 0; i < size; i++) {
        cur_track = arr[i];

        // calculate absolute distance
        distance = abs(cur_track - head);

        // increase the total count
        seek_count += distance;

        // accessed track is now new head
        head = cur_track;
    }

    cout << "Total number of seek operations = "
         << seek_count << endl;

    // Seek sequence would be the same
    // as request array sequence
    cout << "Seek Sequence is" << endl;
```

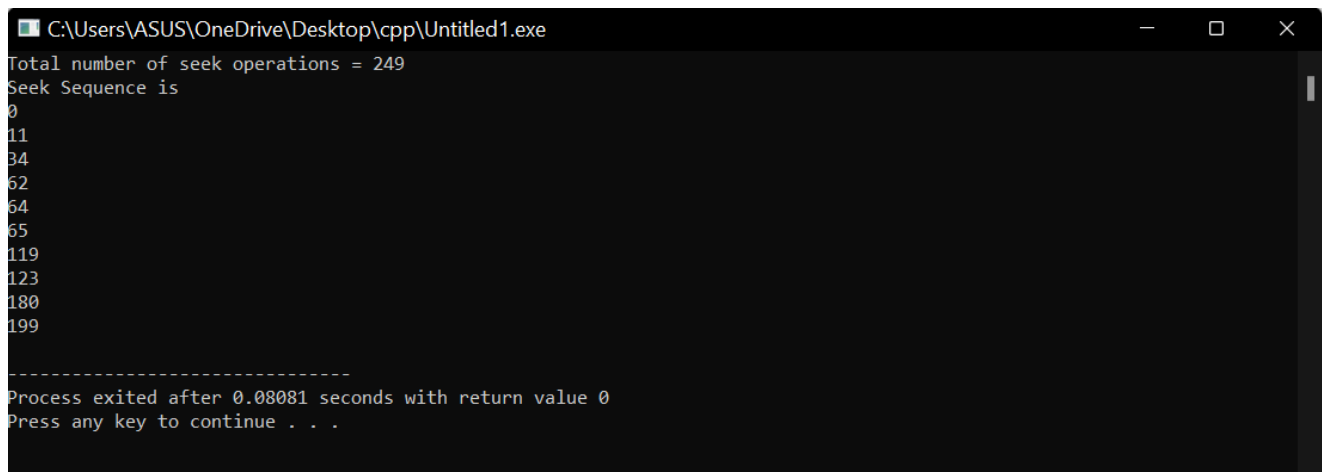

```
        for (int i = 0; i < size; i++) {
            cout << arr[i] << endl;
        }
    }

// Driver code
int main()
{
    // request array
    int arr[size] = { 0,11,34,50,62,64,65,119,123,180,199 };
    int head = 50;

    FCFS(arr, head);

    return 0;
}
```

c) Output:

```
C:\Users\ASUS\OneDrive\Desktop\cpp\Untitled1.exe
Total number of seek operations = 249
Seek Sequence is
0
11
34
62
64
65
119
123
180
199

Process exited after 0.08081 seconds with return value 0
Press any key to continue . . .
```

Result:

Total Head Movement Required Serving All Requests 249.

Experiment-10

SSTF Disk Scheduling Algorithm

Name of Student: Abhishek Singh		Class: BTech
Enrollment No: 0827CI201008		Batch
Date of Experiment	Date of Submission	Submitted on:
Remarks by faculty:		Grade:
Signature of student:		Signature of Faculty:

OBJECTIVE OF THE EXPERIMENT

To implement SSTF Disk Scheduling Algorithm

FACILITIES REQUIRED

a) Facilities Required To Do The Experiment:

S.NO	FACILITIES REQUIRED	QUANTITY
1	System	1
2	Windows XP/7	

b) Concept of SSTF Disk Scheduling Algorithm:

In this case request is serviced according to next shortest distance. Starting at 50, the next shortest distance would be 62 instead of 34 since it is only 12 tracks away from 62 and 16 tracks away from 34. The process would continue until all the process are taken care of. For example the next case would be to move from 62 to 64 instead of 34 since there are only 2 tracks between them and not 18 if it were to go the other way. Although this seems to be a better service being that it moved a total of 236 tracks, this is not an optimal one. There is a great chance that starvation would take place. The reason for this is if there were a lot of requests close to each other the other requests will never be handled since the distance will always be greater.

Algorithm:

Step 1: Create a queue to hold all requests in disk

Step 2: Calculate the shortest seek time every time before moving head from current headposition

Step 3: Calculate the total head movement required to serve all request.

Program:

```
// C++ program for implementation of
// SSTF disk scheduling
#include <bits/stdc++.h>
using namespace std;
void calculatedifference(int request[], int head,
                        int diff[][2], int n)
{
    for(int i = 0; i < n; i++)
    {
        diff[i][0] = abs(head - request[i]);
    }
}
int findMIN(int diff[][2], int n)
{
    int index = -1;
    int minimum = 1e9;

    for(int i = 0; i < n; i++)
    {
        if (!diff[i][1] && minimum > diff[i][0])
        {
            minimum = diff[i][0];
            index = i;
        }
    }
    return index;
}

void shortestSeekTimeFirst(int request[],
```

```

                                int head, int n)
{
    if (n == 0)
    {
        return;
    }
    int diff[n][2] = { { 0, 0 } };
    int seekcount = 0;
    int seeksequence[n + 1] = {0};

    for(int i = 0; i < n; i++)
    {
        seeksequence[i] = head;
        calculatedifference(request, head, diff, n);
        int index = findMIN(diff, n);
        diff[index][1] = 1;
        seekcount += diff[index][0];
        head = request[index];
    }
    seeksequence[n] = head;

    cout << "Total number of seek operations = "
          << seekcount << endl;
    cout << "Seek sequence is : " << "\n";

    // Print the sequence
    for(int i = 0; i <= n; i++)
    {
        cout << seeksequence[i] << "\n";
    }
}

// Driver code
int main()
{
    int n = 10;
    int proc[n] = { 0,11,34,62,64,65,119,123,180,199 };

    shortestSeekTimeFirst(proc, 50, n);

    return 0;
}

```

Output:

```
C:\Users\ASUS\OneDrive\Desktop\cpp\Untitled1.exe
Total number of seek operations = 279
Seek sequence is :
50
62
64
65
34
11
0
119
123
180
199
-----
Process exited after 0.07261 seconds with return value 0
Press any key to continue
```

c) Result:

Total Head Movement Required Serving All Requests = 279.
